Venture Vision Ubuntu (VVU)

Investor Package — Pilot Beta Release B.01

Sovereign Digital Twin Architecture with Verifiable Trust

Company

Venture Vision Ubuntu (VVU) builds fail-closed digital twin systems for industrial, healthcare, and operational environments. Domain: venturevisionubuntu.co.za.

Problem

Digital twins silently fail: dropped sensors, hallucinated inferences, corrupted assets. Users cannot distinguish reality from plausible fiction.

Solution

VVU Trust OS: cryptographic commitments, Bayesian confidence scoring, on-chain circuit breakers, visible failure rendering, WORM ledger.

Technology

Edge sensors !’ WORM ledger !’ 3D render !’ on-chain anchor (Polygon Amoy). AMD-attested GPU pipeline (ROCm/MI300X). Sub-ms Bayesian circuit breakers.

Compliance

POPIA §26 special personal information handled as volatile RAM, SHA-256 hashes only, tombstoned on request. No biometric retention.

Validation

TypeScript 0 errors, ESLint clean, unit tests pass, Lighthouse >50, branded validation report.

Pilot Beta B.01

Controlled pilot deployments with signed pilot agreements. Fail-closed demos: vv-fail-closed.html, isuzu-industrial-twin.html.

Ask

Seed funding to scale pilot deployments and harden the sovereign substrate for enterprise rollout.
